Since its creation in 2007, Eovations™ technology has perfected the substrate found in several Deckorators® decking products. The unique process starts with a mixture of polypropylene and calcium carbonate that’s pultruded, which creates cavitation or tiny air pockets. This keeps the boards lightweight, but with a fiber-like structure similar to wood, providing unmatched strength.

Deckorators® wood plastic composite decking is created by a unique extrusion process resulting in a stronger and more reliable deck board. The boards are capped on three sides with some of the most durable polymer technology available.
